

In December APRS World was commissioned to design a data logging system for Midnite Solar. The system will be used to monitor performance of their new Classic MPPT charge controller. Robin and Bob Gudel of Midnite Solar are already thrilled to be able to keep an eye on their remote test site over the Internet.

Will took a trip to Long Island to see one of our customers, Roy Rakobitsch. Roy lives off grid in Westhampton, Long Island.

His home is powered with two solar arrays, a wind turbine of his own construction, as well as a straight vegetable oil backup Lister generator. He has been a DIY wind turbine expert and solar installer for many years. Roy began using APRS World products several years ago, and has since used them for various wind studies around Long Island. Pictured is an anemometer and wind vane setup Roy uses to monitor an Eoltec 6kW machine he installed in December of this year.
